Sai Teja K

Cloud Infrastructure Analyst | SRE | DevOps | AWS | Kubernetes & OpenShift | Terraform | Ansible

tejakumbham@gmail.com | Florida | Open to relocation

PROFESSIONAL SUMMARY

- Cloud Infrastructure and DevOps professional with 5+ years of experience building, running and monitoring cloud infrastructure, Infrastructure as Code and container platforms on AWS and Azure, with delivery in financial services (JPMorgan Chase), energy and utilities, and telecommunications, all highly regulated environments.
- Build end-to-end pipelines in Jenkins, Harness, Tekton, GitHub Actions and Azure DevOps with SonarQube, Snyk and Checkmarx gates built in, reducing deployment failures by up to 40% and release turnaround by 45%.
- Provision cloud and on-prem RHEL infrastructure with reusable Terraform modules and Ansible roles (60% less manual effort), and run containerized workloads on Kubernetes (EKS, AKS) and Red Hat OpenShift using Helm, including canary and blue-green releases, autoscaling and production troubleshooting.
- Treat security as part of the pipeline: HashiCorp Vault and Azure Key Vault for secrets, IAM and RBAC least privilege, image and dependency scanning, vulnerability remediation and audit-ready change records (SOX, PCI-DSS, NERC CIP).
- Own reliability, SLOs, on-call and incident response with Prometheus, Grafana, ELK, Splunk, AppDynamics and CloudWatch; lead root cause analysis and mentor junior engineers on DevOps standards.

TECHNICAL SKILLS

CI/CD & Release: Jenkins, Harness, Tekton (OpenShift Pipelines), GitHub Actions, GitLab CI, Azure DevOps Pipelines (YAML), Argo CD (GitOps), Maven, Gradle, JFrog Artifactory, Nexus, release management

Source Control: Git, GitHub, Bitbucket, GitFlow and trunk-based branching, pull request reviews

Infrastructure as Code: Terraform (modules, remote state, workspaces), AWS CloudFormation, ARM Templates

Configuration Management: Ansible (playbooks, roles, Ansible Tower/AWX)

Containers & Orchestration: Docker, Kubernetes, Red Hat OpenShift (OCP), Amazon EKS, Azure AKS, Helm, Istio service mesh

Cloud: AWS (EC2, VPC, IAM, S3, EKS, ECS, ECR, Lambda, RDS, KMS, Secrets Manager, Route 53, Auto Scaling, ELB, CloudWatch, Systems Manager, SNS, SQS); Azure (AKS, Virtual Machines, Key Vault, Monitor, Virtual Network, Load Balancer)

DevSecOps & Security: SonarQube, Snyk, Checkmarx, BlackDuck, Trivy, HashiCorp Vault, Azure Key Vault, IAM, RBAC, SSL/TLS, Security Groups, Network ACLs, vulnerability remediation, SOX, PCI-DSS, NERC CIP

Monitoring & Observability: Prometheus, Grafana, ELK Stack, Splunk, AppDynamics, Amazon CloudWatch, Azure Monitor, Application Insights, PagerDuty, SLIs/SLOs, error budgets, on-call

Scripting & Programming: Python, Bash, Shell, PowerShell, YAML, SQL (PostgreSQL, MySQL), Go and Java (working knowledge)

Operating Systems: Linux (RHEL 7/8/9, Ubuntu, Amazon Linux), Windows Server

AI Tools: GitHub Copilot, LLM-assisted log analysis, AI-assisted code review, Model Context Protocol (MCP)

ITSM & Methodologies: ServiceNow, Jira, Confluence, Agile/Scrum, SDLC, change management (CAB), incident and problem management, RCA

PROFESSIONAL EXPERIENCE

NextEra Energy | Juno Beach, FL **Aug 2024 – Present**

Site Reliability Analyst

Project: Grid Operations Reliability | Keeping outage-management and meter-data services on EKS and OpenShift stable for control-room and field-crew users, especially during storm season.

- Part of the weekly on-call rotation for P1/P2 incidents through PagerDuty and ServiceNow: triage the alert, pull logs from Splunk and CloudWatch, bring app teams onto the bridge call, then write the RCA and follow-up Jira tickets.
- Worked with app teams to define SLIs and SLOs (availability, p95 latency, error rate) for the outage-map and meter-read APIs, and rebuilt Prometheus and Grafana alerts around them so on-call stopped getting paged for noisy CPU alerts; production availability improved by 35%.
- Troubleshoot day-to-day Kubernetes and OpenShift issues such as CrashLoopBackOff and OOMKilled pods, ImagePullBackOff from expired registry credentials, PVC mount failures and nodes going NotReady, and turn each fix into a Confluence runbook.
- Tuned HPA settings and resource requests/limits for services that spike during storm events, and load-tested them with JMeter before hurricane season so pods scaled out before latency degraded.
- Wrote Ansible roles and Python/Bash scripts for monthly RHEL patching, log rotation, disk cleanup and health checks that used to be done by hand in weekend windows, saving roughly 15 engineering hours a week.
- Review changes and rollback plans in the weekly ServiceNow CAB, and mentor 3 junior engineers on on-call and Kubernetes.

Cloud Infrastructure Analyst

Project: Grid Operations Platform Modernization | Moving outage-management and meter-data microservices from on-prem RHEL servers to AWS EKS and Red Hat OpenShift.

- Built modular Terraform for VPC, subnets, EKS, IAM and RDS with remote state in S3 and DynamoDB locking; every change goes through a pull request with the terraform plan reviewed in the pipeline, cutting manual provisioning effort by 60%.
- Migrated 25+ microservices from on-prem RHEL servers to EKS and OpenShift in waves, running old and new side by side and shifting traffic with Route 53 weighted records, with no customer-facing downtime.
- Ran EKS upgrades across dev, QA and prod (deprecated API checks, add-on upgrades, node groups rolled one at a time) and fixed pods stuck in Pending from subnet IP exhaustion with VPC CNI prefix delegation.
- Moved application secrets out of config files into HashiCorp Vault with dynamic database credentials, tightened IAM roles (IRSA) and Security Groups, and automated SSL/TLS renewal, closing NERC CIP audit findings.
- Set up RDS automated snapshots, multi-AZ failover and S3 versioning, and ran twice-yearly DR tests that restored a production database copy and measured recovery time against target.
- Built Jenkins and GitHub Actions pipelines with SonarQube, Snyk and Trivy gates, plus Harness canary deployments with automatic rollback, reducing failed deployments by 40% and release windows from about 4 hours to under 1.

JPMorgan Chase **Mar 2023 – Jul 2024**

DevOps Engineer

Project: Payments Platform CI/CD Standardization | Consolidating build and release for card-payments and treasury microservices onto Azure DevOps, AKS and OpenShift.

- Built multi-stage Azure DevOps YAML pipelines from shared templates so 40+ Java and .NET services followed the same build, scan and deploy stages, reducing deployment failures by 25%.
- Provisioned AKS, VNets, Key Vault and load balancers with Terraform modules, cutting environment setup time by 40%.
- Packaged payments services as Helm charts and deployed them to AKS and OpenShift, handling rolling updates, readiness/liveness probe tuning and pod scaling during month-end processing peaks.
- Added SonarQube, Checkmarx and BlackDuck gates that failed builds on critical vulnerabilities or license issues, and pulled pipeline evidence for SOX and PCI-DSS audits.
- Worked with InfoSec to remediate 200+ vulnerabilities by patching base images, upgrading libraries and rebuilding containers, and tracked fixes for quarterly security assessments.
- Built Splunk dashboards and Prometheus/Grafana alerts on latency and error rates for faster triage on bridge calls.
- Led the move of legacy Jenkins jobs to Azure DevOps with 5 application teams, wrote the Confluence runbooks, and set GitFlow branching and pull request policies across 6 teams.

Verizon **Jan 2021 – Jun 2022**

Cloud Engineer

Project: Network Analytics Cloud Migration | Provisioning EC2, VPC, IAM, S3 and RDS to move reporting apps off data center VMs to AWS.

- Right-sized EC2 from CloudWatch metrics and moved old reports to Glacier with S3 lifecycle rules, cutting costs by 18%.
- Wrote Ansible playbooks for standard server builds (users, packages, monitoring agents, OS hardening), bringing new server setup down from a full day to under 2 hours.
- Containerized legacy Java applications with Docker and set up Jenkins jobs with Maven and Nexus, giving the team its first working CI pipelines.
- Built CloudWatch alarms with SNS notifications for disk, CPU and application health checks, reducing incident response time by 30%, and handled Linux patching, backups and DR validation.

PROJECTS

Secure GitOps Delivery Platform on AWS | Terraform, EKS, Jenkins, Argo CD, Helm, Vault, SonarQube, Trivy, Istio, Prometheus

- Built a reference platform where Terraform provisions the VPC and EKS cluster, Jenkins builds, tests and scans container images before pushing to ECR, and Argo CD syncs Helm releases from Git to the cluster.
- Injected secrets at runtime with the Vault Agent Injector, enforced mTLS between services with Istio, and tracked latency, traffic, errors and saturation on Grafana dashboards.

AI-Assisted Incident Triage with MCP | Python, Model Context Protocol, LLM, Kubernetes API, Prometheus API

- Building a Python MCP server that exposes Kubernetes events, Prometheus metrics and recent logs to an LLM, so an on-call engineer can ask "why is this pod restarting?" and get the relevant evidence plus suggested runbook steps.

EDUCATION

Master of Science in Computer Science | Lewis University, Romeoville, IL
