Sai Teja K

DevOps Engineer | CI/CD | Kubernetes & OpenShift | Terraform | Ansible | AWS | DevSecOps

saitejagoudk01@gmail.com | Florida | Open to relocation

PROFESSIONAL SUMMARY

- DevOps Engineer with 5+ years of experience building CI/CD pipelines, Infrastructure as Code and container platforms on AWS and Azure, with delivery in financial services (JPMorgan Chase), energy and utilities, and telecommunications, all highly regulated environments.
- Build end-to-end pipelines in Jenkins, Harness, Tekton, GitHub Actions and Azure DevOps with SonarQube, Snyk and Checkmarx gates built in, reducing deployment failures by up to 40% and release turnaround by 45%.
- Write reusable Terraform modules and Ansible roles to provision and configure cloud and on-prem RHEL infrastructure, cutting manual provisioning effort by 60%.
- Run containerized workloads on Kubernetes (EKS, AKS) and Red Hat OpenShift using Helm, including canary and blue-green releases, autoscaling and production troubleshooting.
- Treat security as part of the pipeline: HashiCorp Vault and Azure Key Vault for secrets, IAM and RBAC least privilege, image and dependency scanning, vulnerability remediation and audit-ready change records (SOX, PCI-DSS, NERC CIP).
- Own monitoring and incident response with Prometheus, Grafana, ELK, Splunk, AppDynamics and CloudWatch; lead root cause analysis and mentor junior engineers on DevOps standards.
- Automate with Python, Bash and PowerShell, and use GenAI tools (GitHub Copilot, LLM-assisted log analysis) to speed up scripting, code review and troubleshooting.

TECHNICAL SKILLS

CI/CD & Release: Jenkins, Harness, Tekton (OpenShift Pipelines), GitHub Actions, GitLab CI, Azure DevOps Pipelines (YAML), Argo CD (GitOps), Maven, Gradle, JFrog Artifactory, Nexus, release management

Source Control: Git, GitHub, Bitbucket, GitFlow and trunk-based branching, pull request reviews

Infrastructure as Code: Terraform (modules, remote state, workspaces), AWS CloudFormation, ARM Templates

Configuration Management: Ansible (playbooks, roles, Ansible Tower/AWX)

Containers & Orchestration: Docker, Kubernetes, Red Hat OpenShift (OCP), Amazon EKS, Azure AKS, Helm, Istio service mesh

Cloud: AWS (EC2, VPC, IAM, S3, EKS, ECS, ECR, Lambda, RDS, KMS, Secrets Manager, Route 53, Auto Scaling, ELB, CloudWatch, Systems Manager, SNS, SQS); Azure (AKS, Virtual Machines, Key Vault, Monitor, Virtual Network, Load Balancer)

DevSecOps & Security: SonarQube, Snyk, Checkmarx, BlackDuck, Trivy, HashiCorp Vault, Azure Key Vault, IAM, RBAC, SSL/TLS, Security Groups, Network ACLs, vulnerability remediation, SOX, PCI-DSS, NERC CIP

Monitoring & Observability: Prometheus, Grafana, ELK Stack, Splunk, AppDynamics, Amazon CloudWatch, Azure Monitor, Application Insights, PagerDuty

Scripting & Programming: Python, Bash, Shell, PowerShell, YAML, SQL (PostgreSQL, MySQL), Go and Java (working knowledge)

Operating Systems: Linux (RHEL 7/8/9, Ubuntu, Amazon Linux), Windows Server

AI Tools: GitHub Copilot, LLM-assisted log analysis, AI-assisted code review, Model Context Protocol (MCP)

ITSM & Methodologies: ServiceNow, Jira, Confluence, Agile/Scrum, SDLC, change management (CAB), incident and problem management, RCA

PROFESSIONAL EXPERIENCE

NextEra Energy | Juno Beach, FL **Aug 2024 – Present**

DevOps Engineer

Project: Grid Operations Platform Modernization | Moving outage-management and meter-data microservices from on-prem RHEL servers to AWS EKS and Red Hat OpenShift.

- Built modular Terraform code for VPC, EKS, IAM and RDS with remote state in S3 and DynamoDB locking, cutting manual provisioning effort by 60% and keeping dev, QA and prod environments identical.
- Designed Jenkins and GitHub Actions pipelines with SonarQube quality gates, Snyk dependency scans and Trivy image scans, reducing failed deployments by 40%.
- Introduced Harness for continuous delivery with canary and blue-green strategies and automatic rollback on failed health checks, shrinking release windows from about 4 hours to under 1 hour.
- Migrated 25+ microservices to Amazon EKS and OpenShift using Helm charts and Tekton pipelines, with Auto Scaling Groups and load balancers in front, and no customer-facing downtime during cutover.
- Administer Kubernetes and OpenShift clusters day to day: namespaces, resource quotas, HPA autoscaling, rolling updates, and troubleshooting pod, network and storage issues in production.

- Moved application secrets out of config files into HashiCorp Vault with dynamic credentials and automated SSL/TLS certificate renewal, closing audit findings tied to NERC CIP controls.
- Set up Prometheus, Grafana and CloudWatch dashboards with SLO-based alerts routed to PagerDuty, improving production availability by 35%; lead post-incident RCA reviews.
- Wrote Ansible roles and Python/Bash scripts for RHEL patching, log rotation and health checks, saving roughly 15 engineering hours a week.
- Mentor 3 junior engineers on Terraform, Kubernetes and pipeline standards, and raise production changes through the ServiceNow CAB process with developers and QA.

JPMorgan Chase **Mar 2023 – Jul 2024**

DevOps Engineer

Project: Payments Platform CI/CD Standardization | Consolidating build and release for card-payments and treasury microservices onto Azure DevOps, AKS and OpenShift.

- Built multi-stage Azure DevOps YAML pipelines with reusable templates for 40+ Java and .NET services, reducing deployment failures by 25%.
- Provisioned Azure infrastructure (AKS, Virtual Networks, Key Vault, Load Balancers, Azure Monitor) with Terraform, cutting environment setup time by 40%.
- Packaged services as Helm charts and deployed them to AKS and OpenShift, handling rolling updates, scaling and production stability for payments workloads.
- Added SonarQube, Checkmarx and BlackDuck scans to every pipeline so builds failed on critical vulnerabilities or license issues, and produced the evidence used in SOX and PCI-DSS audits.
- Worked with InfoSec to remediate 200+ infrastructure and container vulnerabilities and supported quarterly security assessments.
- Configured Prometheus, Grafana, Splunk, Log Analytics and Application Insights alerts on latency and error rates, which made incident triage noticeably faster.
- Led the workstream that moved legacy Jenkins jobs to Azure DevOps, coordinating with 5 application teams and writing the runbooks in Confluence.
- Defined GitFlow branching, pull request policies and release tagging across 6 teams, reducing merge conflicts and making every release traceable.
- Automated routine admin work with PowerShell and Bash, and supported RHEL servers (package management, service configuration, troubleshooting).

Verizon **Jan 2021 – Jun 2022**

Cloud Engineer

Project: Network Analytics Cloud Migration | Moving internal network-analytics and reporting applications from data center VMs to AWS.

- Provisioned and maintained AWS infrastructure (EC2, VPC, IAM, S3, RDS) for enterprise applications across development and testing environments.
- Right-sized EC2 instances and applied S3 lifecycle policies, reducing compute and storage costs by 18%.
- Wrote Ansible playbooks and shell scripts to standardize server builds, bringing new server setup down from a full day to under 2 hours.
- Helped containerize legacy Java applications with Docker and set up Jenkins build jobs with Maven and Nexus, giving the team its first working CI pipelines.
- Built CloudWatch alarms with SNS notifications, reducing incident response time by 30%, and handled Linux administration including patching, backups and disaster recovery validation.

PROJECTS

Secure GitOps Delivery Platform on AWS | Terraform, EKS, Jenkins, Argo CD, Helm, Vault, SonarQube, Trivy, Istio, Prometheus

- Built a reference platform where Terraform provisions the VPC and EKS cluster, Jenkins builds, tests and scans container images before pushing to ECR, and Argo CD syncs Helm releases from Git to the cluster.
- Injected secrets at runtime with the Vault Agent Injector, enforced mTLS between services with Istio, and tracked latency, traffic, errors and saturation on Grafana dashboards.

AI-Assisted Incident Triage with MCP | Python, Model Context Protocol, LLM, Kubernetes API, Prometheus API

- Building a Python MCP server that exposes Kubernetes events, Prometheus metrics and recent logs to an LLM, so an on-call engineer can ask "why is this pod restarting?" and get the relevant evidence plus suggested runbook steps.

EDUCATION

Master of Science in Computer Science | Lewis University, Romeoville, IL
